TITLE: Nutritional value of army bread

SOURCE: Lekarz wojskowy, no. 7, 1966, 596-601

TOPIC TAGS: food, food chemistry, vitamin, armed force supply

ABSTRACT: The problem of the nutritional value of the various kinds of bread used in the Polish Armed Forces is discussed in this article. Three main categories are considered: 1) rye breads, 2) wheat breads, and 3) mixed (rye and wheat) breads. The most commonly used breads at the present time in the Polish Army are the "rembertow" and "pisk" mixed varieties. The purpose of the paper was to determine by actual testing and through a system of analytical designations the true value of a certain number of nutritional factors in mixed rye-wheat army bread. Test samples were taken from three military bakeries located in different regions of the country. Five 2-kg loaves were taken at random from different portions of a baking batch.

Card 1/2

I 04881-67

ACC NR: AP6026290

Twenty-four hours after baking, sections from each loaf were removed and blended with similar sections from the remaining four loaves of the same test group. The test samples so obtained were checked for a total of 11 nutritional factors, including vitamins and minerals. Two tables are given illustrating the chemical composition of 100 of both types of army bread (rembertow and plsk). It was found that differences in the basic nutritional values in the bread types examined are not significant, although there are some divergencies in vitamin content. It also appears that differences in the same kind of bread, but obtained from different bakeries, are also negligible. Orig. art. has: 3 tables.

TITLE: Measurements of tropospheric scatter propagation at
600 Mc/s
SOURCE: Warsaw. Przemyslowy Instytut Telekomunikacji. Prace,
v. 10, no. 31, 1960, 39 - 66

TEXT: Methods are described and results are presented of a series of sample measurements performed in 1957-1958 on Warsaw - Wrocław, Warsaw - Gdańsk and Warsaw - Poznań routes. Route profiles and the distribution of measuring points are shown. The relation between the field strength and the probability of its occurrence was determined, for hourly intervals, by means of a five level recorder, with 3 dB spacing between levels; number of pulses recorded at each level is the measure of the observation time fraction in which this level was exceeded. Field strength was also recorded by a continuously operating low speed voltmeter and by a fast speed recording voltmeter which operated at five minute intervals over selected periods. Meteorological conditions were observed simultaneously

 / Shielded arc welding of austenitic 18/8 steel in argon atmosphere. I. Andrzej Didkowiak and Julian Kieronski. *Przeegląd. Spawalniczo* 10, 218-21(1958). The welding properties of austenitic steel 18/8 were briefly described, and difficulties in obtaining a well-made weld joint were outlined. By C₂H₂ welding defects were likely to occur because of comparatively low intensity of heating; there are also possibilities of forming Cr compds. with O or C. To avoid these defects shielded arc-welding in Ar was recommended, and the advantages thereof were discussed. It was possible to apply higher speed of welding, limit the heat-affected zone, and eliminate high welding stresses and distortions. The conditions which Ar should meet to be suitable for shielded arc-welding were discussed. The addn. of N and O should be limited to 18 and 0.2%, resp. Water vapor could be present only as a trace. The equipment for purifying of Ar was described. The O was sepd. by reaction with Cu chips at elevated temp. For Ar drying silica gel and cryst. KOH were used. W. Tomaszczak

D219/D304

AUTHORS: Didkowski, Andrzej, and Kieroński, Julian,
Engineers

TITLE: Gas-shielded arc welding

PERIODICAL: Technika lotnicza, no. 9, 1961, 204-210

TEXT: This article reviews gas shielded arc welding technology and comments on its merits. The source of heat in the above-mentioned method is an electric arc between the welded object and an electrode which is made of either non-melting or melting material. The electrode made of non-melting material is extensively used in welding thin walled elements and is primarily discussed in the article. The arc and its vicinity are shielded by inert gases (argon, helium) or carbon dioxide and to lesser extent by nitrogen. The shielding gases are blown from the handle, or when welding elements of complicated shapes or high oxygen affinity (e.g. titanium and its alloys) the welding is done in chambers filled with the shielding gases. The welding

Card 1/4

Gas-shielded arc welding

D/008/61/000/009/003/004
D219/D304

stand consists of 1) welding apparatus, 2) welding handle, 3) bottle containing shielding gas, 4) gas pressure reducing mechanism; 5) valve regulating gas flow. For welding steel d.c. is suited best. For light alloys, high frequency a.c. Welding handles used for thick elements, output larger than 120 A, are water-cooled. After switching off the current, the shielding gas should flow a while longer; this prevents the oxidization of the electrode ending and the weld itself. For aluminum welding the apparatus should be fitted with a condenser or at least a resistance to counteract the rectifying effect of the arc. The welding process should be adjusted to the optimum conditions (voltage, size of electrode, gas outlet and gas output and speed of welding) according to material, shape to be welded and thickness. The authors follow with a brief description of the welding technique and correct procedure. The main merits of arc welding in gas shield are the possibility of welding thin walled elements, alloys of aluminum, magnesium and titanium, corrective welding of assembled elements, elimination of fusing materials from the process, clean appearance and good mechanical and anti-corrosive

Card 2/4

Gas-shielded arc welding

P/008/61/000/009/003/004
D219/D304

properties of the weld, simplicity of the process and the possibility of making it automatic. The above points are enlarged and comments are made on the superiority of the method, as compared to other welding processes. The handicaps are the high price of pure shielding gases and the tungsten electrode, the need for thoroughly cleaning the edges and fitting of the welded elements. Then the authors discuss welding of steels. After pointing out the difficulties of gas welding, such as cracks, oxidization, deformation, carbonization in the welding of austenitic and nickel chromium steel, the authors say that they can be eliminated by using gas shielded arc welding. In tables they give welding parameters for steel gap welding, joint efficiencies and resistance to corrosion respectively for steel 1H18N9T, for gas-shielded arc welds and for acetylene and unshielded arc welds. Graphs give the mechanical properties of welded and original material for steels 1H18N9T and H20N80T respectively. In welding of stainless steels, the mechanical properties are shown; the advantages of gas-shielded welding are the elimination of cracks, formed by other methods of welding. In welding

Card 3/4

Gas-shielded arc welding

P/008/61/000/009/003/004
D219/D304

light alloys, gas-shielded arc welding is particularly advantageous as the aluminum oxides present no problem here and it is possible to obtain efficient joints for concave sections. The above method is also the only one for welding. It is also used for welding aluminum castings and magnesium and its alloys. There are 8 figures and 8 tables.

3492. PROBLEMS OF LATE CONJUGAL SYPHILIS - Problematyka późnej kity
matzeńskiej - Kiersńska I. and Wąsik F. Klin. Dermatol. A. M.;
Ośrod. Konsult. Woj. Pół. Śk. Wen., Wrocław - PRZEGL. DERM. WENER.
1958, 8/4 (429-433) Tables 2

Sixty-four conjugal couples affected by late syphilis were examined by all specialists concerned. Only cases in which there was a probability of mutual infection, untreated or treated in the same manner, were considered. A high proportion of neurosyphilis was found, with a distinct majority in males (48%). Syphilis of the cardiovascular system was found in 17.3%. In 7.8% of the cases, syphilis attacked both the nervous and cardio-vascular systems. In almost half the cases, in married couples, neurosyphilis was found in both partners. Analysis of the results seems to suggest a necessity of more frequent neurological control and proper treatment of a partner whose mate shows symptoms of neurosyphilis. These results do not deny, but rather confirm, the theory about the neurotrophism of *Treponema pallidum*.

The liver in dye shock. B. Czarnecki, J. Kiersz, and R. Mirkowski (Univ. Poznan, Poland). *Intern. Arch. Allergy Appl. Immunol.* 1, 285-91 (1951).—Trypan blue in an intravenous dose of 0.1 g./kg. produces shock in dogs similar to anaphylaxis with fall in blood pressure. The complete exclusion of the liver from the circulation prevents dye-produced shock. Shock will occur immediately if the dye is able to reach the liver only through a constricted hepatic artery. Apparently the liver is essential for the dye shock, possibly as a source of histamine or similar substances. The influence of antistine on the production and course of shock produced with dyes. *Ibid.* 292-9.—The fall of blood pressure in dogs injected intravenously with trypan blue is prevented if 0.05 g. of antistine is given 1.5 min. before the dye. Given at a longer period before the injection of dye it only partially prevents the fall in blood pressure. The blood pressure does not immediately return to normal when antistine is given after the injection of trypan blue but recovery is nevertheless quicker than in controls. Julian H. Lewis

Kierz, J.

MD ✓ Changes occurring in the blood following injection of dyes. B. Czarnecki, J. Kierz, and B. Mietkiewski (Univ. Poznan, Poland). *Więst. Alerg. i Imunol.* 2, 8-18(1951).--Immediately after intravenous injection into dogs of 0.1 g/kg. of either trypan blue or Congo red the animal shows an increased flow of saliva, change in respiration, vomiting, a lowering of the blood pressure, and other symptoms of shock. The erythrocyte sedimentation rate is decreased, coagulation time is increased, the blood viscosity is increased, and the f.p. depression of serum decreases during the first 10 min. after the introduction of the dyes, while these changes are reversed within 1.5 to 3 hrs. Platelets are absent during shock. The authors conclude that the shock resulting from the injection of dyes is provoked by a derangement of the histocyte system, paralleling anaphylactic shock. B. I. B.

KIERZ, J.

✓ Interference with biliary secretion following the injection of dyes. H. Czarnecki, J. Kierz, and E. Mielkiewski. *Intern. Arch. Allergy and Appl. Immunol.*, 2: 23-8 (1951).—
MM In certain dogs a complete arrest of bile secretion within 10 min. after the injection of trypan blue was found. In others a slow decrease to zero was noted. This was attributed to histologic changes in the liver following blockage of the reticulo-endothelial system by the dye. Elmer L. Becker

Dilatation of vessels in the abdominal cavity and pooling of blood in the liver area is the essential cause of the fall of blood pressure in dye shock in the dog. The vasodilatation is the result of increased parasympathetic activity. Section of the abdominal vagus nerves prevents the sudden fall of blood pressure, but the increased cholinergic activity resulting from administration of arecoline is such that peripheral vasodilation results in other areas, so that the blood pressure then drops in spite of exclusion of the abdominal vagus. The effect of atropine on the action of adrenaline. Hiss et al. (1952). J. Pharm. Exptl. Ther. 125: 215-222. Adrenaline (1:1000) was injected into the eye of the rabbit. The fall of arterial pressure which followed by an injection of 0.1-0.2 mg. of trypan blue in each eye was 4-5 times as great as that of 1 mg. of adrenaline. This response is considerably less after injection of 100 mg. of atropine. Atropine seems to neutralize the effect of adrenaline by acting on the same point, i.e. the endings of the parasympathetic (cholinergic) nerves.

Experimental observations on the effect of reserpine on the blood sugar level ACTA PHYSIOL. POL. 1957. 8/1 (125-138) Graphs 6

In dogs put to sleep by chloralose, after 1 mg./kg. of reserpine (I) i.v., the blood glucose rose to 205% of the original value. In no experiment was a fall in blood sugar level noted after I injection. There were no signs of combined action of I and insulin, on the contrary I counteracts the sugar-reducing effect brought about by I U./kg. dose of insulin. After adrenalectomy I does not cause an increase in glucose and also prevents a decrease. The hyperglycaemic action of I is evident not only in adrenalectomized dogs but even with simultaneous administration of insulin. Adrenalectomized dogs lived longer than those injected with I. This suggests an increased demand for hormones of the adrenal cortex because of the I administration. From a physiological analysis of these experiments we can suppose that I displays, apart from an inhibitory effect on the hypothalamus and centres or paths of the sympathetic system together with an eventual stimulatory effect on the parasympathetic system, an 'adrenotonic' or 'contra-insular' peripheral action which is partially maintained after removal of the adrenal

Title : The Effect of Diet on Blood Urea Clearance in Experimental Uremia.

Orig Pub: Acta physiol. polon., 1957, 8, No 2, 217-228.

Abstract: A carbohydrate diet (CD) maintained the life of dogs for 10 days following removal of 3/4 of one kidney, the second one having been removed previously. The elevated values of blood urea (I) following the operation decreased during maintenance on CD, and returned to almost normal (70-80 mg %) within 10 days. Transfer of the animal to a protein diet raised I to the level of 280mg% within 2 weeks. Blood glucose decreased at the

TITLE : Experimental Study of the Influence of Desoxycorticosterone upon the Hypotensive Action of Reserpine in After-Infusion Hypertension
ORIG. PUB. : Acta. polska, 1958, 9. No 1, 29-34

ABSTRACT : In rabbits administered 5 mg of desoxycorticosterone acetate during the first three days, and 2% hypertonic NaCl solution on the fourth day in an amount of 1/3 of the blood volume, reserpine in a dose of 0.5 mg/kg produced an insignificant and slowly developing hypotension, as compared with the control.

2511. EXPERIMENTAL STUDY OF EFFECTS OF DIHYDRALAZINE PLUS RESERPINE ON BLOOD SUGAR - Obserwacje doświadczalne wpływu adelfanu na poziom cukru we krwi - Kiersz J. and Krajewski W. Zakł. Farmakol. A.M., Białymstok - ACTA PHYSIOL. POL. 1959, 10/3 (389-398) Graphs 1 Tables 4

Dihydralazine plus reserpine (5 tablets of the commercial preparation 'adelphan' per kg.) was administered intragastrically in cloraled dogs. The blood sugar level fell after 30 min. and usually reached its lowest value at three and a half hour, the hypoglycaemic effect being still clearly evident after 10 hr.
